Energy Products Software — Hiring Team

August 12, 2026

TESLA

Application for Staff Fullstack Software Engineer, Powerwall Sales Tools

Dear Tesla Hiring Team,

I am applying for the **Staff Fullstack Software Engineer** role on the Powerwall Sales Tools team. A greenfield platform that channel partners use at a homeowner's kitchen table is a rare combination: real product thinking, real data modelling, and a UI that has to work flawlessly on a phone in someone's house.

I work across exactly your stack — **React**, **TypeScript** and API contracts (**GraphQL**/REST) on the front, backend services I implement and scale myself on the back. As Technical Lead at **Okorum Technologies** I own a greenfield national-scale platform end to end, front end and services together in one **Turborepo** monorepo, delivered ahead of a hard regulatory deadline and kept fast under high-volume load with caching, resumable queues and full observability.

The **B2B2C** shape of this role is familiar. At Publicis Global Delivery I ship features to **Unicorn AI**, an internal platform whose configurable agents are used by professionals to serve their own clients — partner-facing tooling, not a consumer app. I also led an e-commerce redesign for **Duluth Trading Company** (Next.js + TypeScript) and drove **+30% in-app engagement** on a **mobile-first** React Native app for **Wegmans**, so I understand building interfaces whose whole purpose is to convert.

On **complex data models**: I have built event-driven systems over **Kafka**, designed a geohash-based geospatial algorithm, and run **MQTT** simulations of device telemetry in Python — time-series and rate-style data that must be modelled correctly before any interface can make it legible. I deploy with **Docker** and cover work with unit, integration and end-to-end tests.

I should be straightforward about one thing: I have not written production **Rust**. I have a systems background (C++, including a WebAssembly codebase, and Go), I pick up languages quickly, and I would be glad to ramp on it — but I would rather tell you that now than imply otherwise.

Tesla's mission is a large part of why I am writing. Thank you for your consideration.

Evidence of Excellence

I ship against deadlines that cannot move. As Technical Lead at Okorum Technologies I built **Rediat** (rediat.app), a national-scale health interoperability platform required by Colombian law (Resolución 1888 de 2025). The deadline was statutory. We delivered ahead of it, and today **roughly 10% of all production RDAs for national health events flow through the platform I built**. I architected it as a **Turborepo** monorepo of **TypeScript** microservices coordinating staged processing over message queues, engineered fault tolerance and resumability so in-flight submissions survive an unreliable government API, and led a cross-functional team through design, review and release on **AWS**.

My work shows up in numbers, not adjectives:

- **Around 10% of national production RDAs** processed through Rediat.
- **+30% in-app engagement** for Wegmans Food Markets (React Native, TypeScript).
- **-25% critical bugs** and **-50% release-cycle time** via testing strategy and CI/CD automation.
- **-50% known vulnerabilities** in four months — an external pentest report from around 800 findings to under 390.
- **Bundle size 3.46 MB → 886 KB; +150% site traffic** after a React rebuild; a **4-month plan compressed into weeks**.

I have been selected on merit against competition: Colombia's "**Ser Pilo Paga**" **national merit scholarship**, awarded on national exam results, which funded my Computer Science and Engineering degree at EAFIT; **1st place at the CivicaPay hackathon** against **52+ teams from 16 universities** with a working mobile payments prototype; and **3rd place at Expo-Ingenierías** for SIMA, an automated irrigation and monitoring system.

I raise the people around me: **100+ students** tutored over a decade, a **4-person QA team** led across 3 products, and **pull-request volume cut 25%** by introducing desk checks.

Sincerely,

Juan Manuel Young Hoyos
